

In the ambiguous case (#8), with $\triangle ABC$ as shown here, we always calculate $\angle B$ first. If we find an acute value of B , it doesn't necessarily mean that an obtuse value of B exists for that triangle. In other words, after finding the acute value of B , we must see if the obtuse value of B makes the \triangle work.

8. Each refers to triangle ABC , which is not necessarily a right triangle. Each of these is of the Angle-Side-Side variety so the ambiguous case applies. From the given information, find all possible triangles, if any exist.

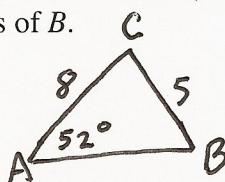

Use this incomplete triangle as the model for your work.

- a) If $A = 52^\circ$, $b = 8$ inches, and $a = 5$ inches, find all possible measures of B .

$$\frac{\sin B}{8} = \frac{\sin 52^\circ}{5}$$

$$\sin B = \frac{8 \cdot \sin 52^\circ}{5}$$

$$\sin B = 1.2608$$

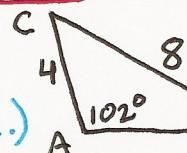

Not a possible triangle

This is not possible because $\sin B$ can never be greater than 1.

- c) If $A = 102^\circ$, $b = 4$ meters, and $a = 8$ meters, find all possible measures of C .

(There is no way $\angle B$ can have an obtuse value here.)

$$\frac{\sin B}{4} = \frac{\sin 102^\circ}{8}$$

$$\sin B = \frac{4 \cdot \sin 102^\circ}{8}$$

$$\sin B = .4891$$

$B = 29.3^\circ$ Because $A = 102^\circ$, this is the only possible value of B , so there is only one possible value of angle C : $C = 180^\circ - (102^\circ + 29.3^\circ)$

$$C = 48.7^\circ$$

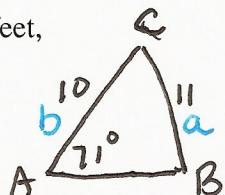

- b) If $A = 71^\circ$, $b = 10$ feet, and $a = 11$ feet, find all possible measures of B .

$$\frac{\sin B}{10} = \frac{\sin 71^\circ}{11}$$

$$\sin B = \frac{10 \cdot \sin 71^\circ}{11}$$

$$\sin B = .8596$$

$$B = 59.3^\circ$$

Because $a > b$, $\angle A$ must be larger than $\angle B$. This

The obtuse value of $\angle B$ is 120.7° , but this also is not possible because $\angle B$ cannot be obtuse. The sum of $\angle A$ and $\angle B$ would be more than 180° .

- d) If $A = 28^\circ$, $b = 12$ cm, and $a = 6$ cm, find all possible lengths of c .

(Because $b > a$, $\angle B$ will have an obtuse value if an acute value exists.)

③ The obtuse value of $\angle B$ is $180^\circ - 69.9^\circ$, $\sim B = 110.1^\circ \sim$

so $\sim C = 41.9^\circ \sim$

④ 2nd value of c :

$$\frac{c}{\sin 41.9^\circ} = \frac{6}{\sin 28^\circ}$$

$$c = \frac{6 \cdot \sin 41.9^\circ}{\sin 28^\circ}$$

$$c = 8.5 \text{ cm}$$

Answer #2

page 5 of 6

$$\frac{c}{\sin 82.1^\circ} = \frac{6}{\sin 28^\circ}$$

$$c = \frac{6 \cdot \sin 82.1^\circ}{\sin 28^\circ} \Rightarrow c = 12.7 \text{ cm}$$

Answer #1

9. The two congruent sides of an isosceles triangle are each 38 centimeters long. If the base is 48 centimeters long, what is the measure of each base angle?

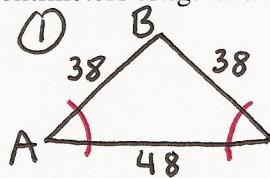

(2)

From the diagram:

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$\cos A = \frac{48^2 + 38^2 - 38^2}{2(48)(38)}$$

$$\cos A = \frac{2,304}{3,648}$$

$\angle A \cong \angle C$
Find $\angle A$ using Law of Cosines

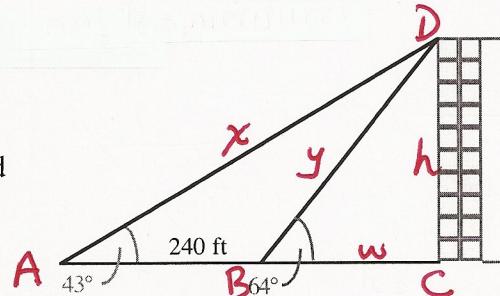

$$A = \cos^{-1}(2,304 \div 3648)$$

$$A = 50.8^\circ \checkmark \rightarrow$$

Each base angle measures 50.8° .

10. A woman standing near a building measures the angle of elevation to the top of the building to be 64° . She then walks 240 feet farther away from the building and measures the angle of elevation to the top of the building to be 43° . How tall is the building? (Round to the nearest foot.)

(4) The building is 411 feet tall.

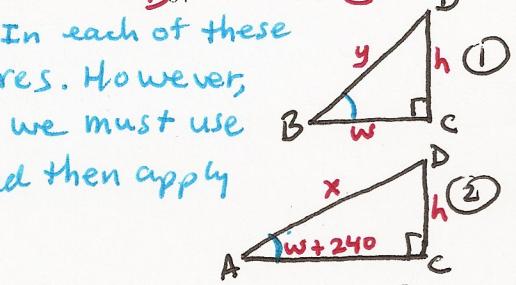

I have labeled each unknown side value. In each of these three Δ 's we can find all three angle measures. However, only ΔABD (3) has a known side value. So, we must use ΔABD to find either x or y (your choice) and then apply that value to either Δ (1) or Δ (2) to find h :

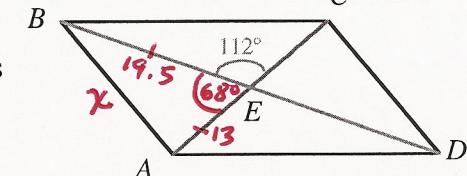

(1) Find the other two angle measures in Δ (3):

$$m\angle B = 116^\circ \text{ and } m\angle D = 21^\circ. \quad (3) \quad \sin 43^\circ = \frac{h}{602}$$

$$(2) \quad \frac{x}{\sin 116^\circ} = \frac{240}{\sin 21^\circ} \Rightarrow x = 602 \quad (1) \quad h = 411 \text{ ft.}$$

11. The diagonals of a parallelogram measure 26 inches (AC) and 39 inches (BD). If they meet at an angle of 112° , what is the length of the shorter side of the parallelogram?

(1) theorem from geometry: the diagonals of a parallelogram bisect each other.

(2) A shorter side of the parallelogram is \overline{AB} and is opposite the acute $\angle AEB$, so find this measure first: $m\angle AEB = 68^\circ$.

(3) $AC = 26$ in., so $AE = 13$ in.; $BD = 39$ in., so $BE = 19.5$ in.

(4) use the Law of Cosines to find AB , labeled x :

$$x^2 = 13^2 + 19.5^2 - 2(13)(19.5)\cos 68^\circ$$

$$x^2 = 359.32$$

$$x = 18.96 \approx 19.0$$

The shorter side of the parallelogram is 19.0 inches long.
